

Superstore-DATA ANALYTICS PROJECT

TELCO CHURN DATA QUESTIONS

- How much revenue did the superstore make?
- Which category generated more revenue?
- Which shipping mode/delivery mode has the huge impact on profit margins.
- How many sales were made?
- Which customer segment goods has the most sales?

DATA SOURCE

- **Is the data valid, credible, accurate and is it from a trusted data source?**

The data is from Kaggle and it is not biased in any way and it has been cleaned and verified to avoid/prevent any errors during the analysis process and also so that the insights are accurate and correct.

DATA CLEANING

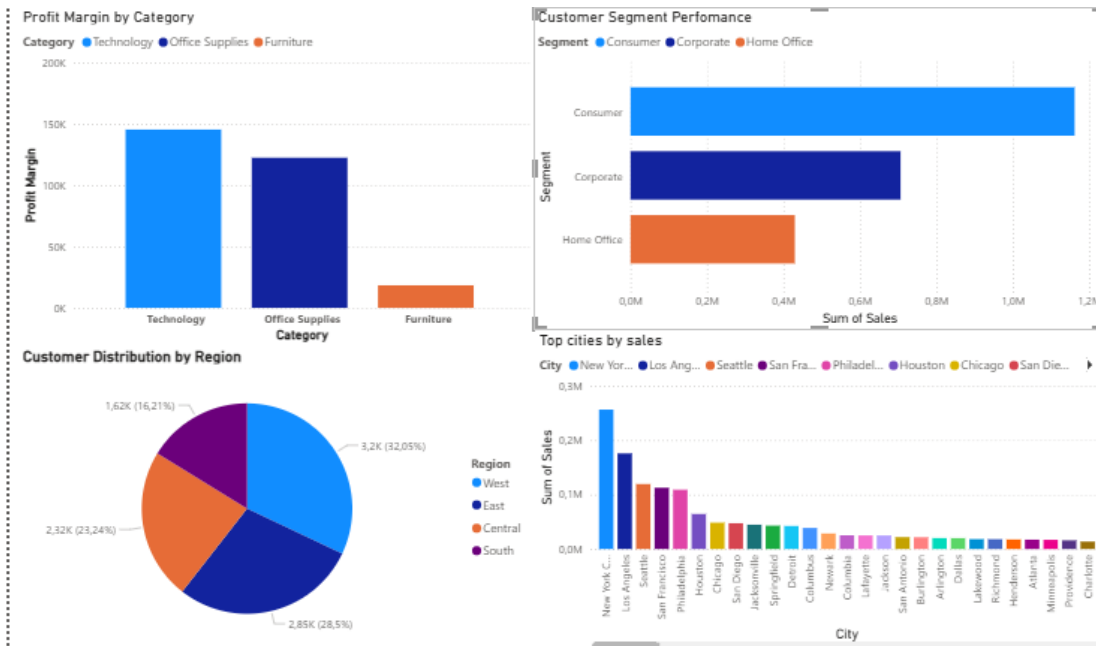

- Data was Cleaned in both Microsoft excel by checking if there are duplicates in the dataset, removing null records, fixing typos and also checking the validity of data in the dataset and removing data that is not valid.

FINDINGS AND INSIGHTS

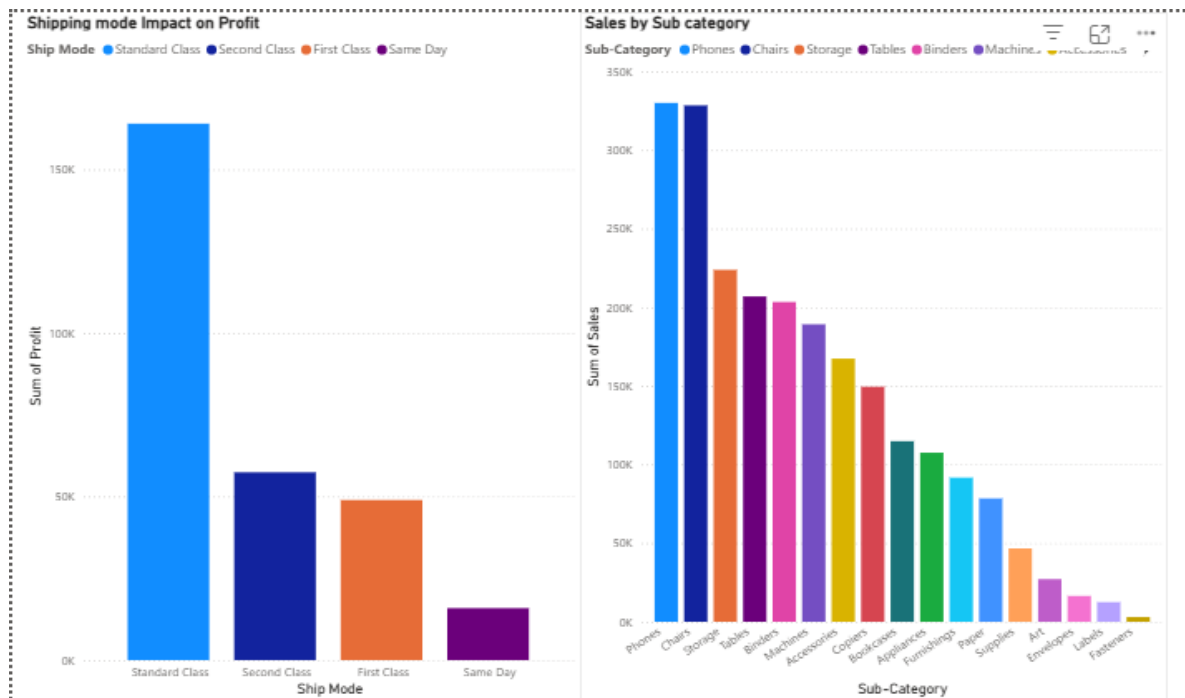

Upon processing and analysing the data about TELCO churn, I discovered the following:

- \$2M was made in revenue.
- 9994 sales were made for the superstore.
- \$286k profit was made from the superstore sales.
- The West is the leading region when it comes to the region that made most sales and which generated high percentage of revenue from the superstore.
- Between 2014 and 2015 the sales were slightly decreasing and from the beginning of the year 2015 the sales started to dramatically and exponentially increase.

- As seen on the chart on the top left corner (Profit margin by category), Technology category is leading the chart on the category with the most profit margin followed office supplies and lastly followed by furniture.
- On the customer segment, consumers spent more money on buying goods or on the sales followed by corporate and lastly home office is the customer segment which spent least money on the sales or purchasing of goods.
- New York, Los Angeles and Seattle are three top cities whereby most sales generated more income or revenue

- Standard class is seen as the best shipping mode when it comes to shipping mode impact on profit. My assumption or insight is that many customers prefer standard shipping mode as it not costly like other shipping modes and does not have additional fees.
- Coming after standard shipping mode, second class shipping mode is the second-best shipping mode because unlike first class shipping, it does not have many additional fees like first class and it is slightly standard shipping mode with just minimal additional fees.
- Lastly, same day shipping mode is the least shipping mode when it comes to shipping mode impact on profit. My assumption/insight is that most people prefer shipping mode that has no additional to minimal additional fees when choosing shipping modes on their orders/purchases. This shipping mode is the least on profit impact as minimal number of people prefer this mode when they need their orders/purchases/goods urgently.
